The Final rejection still stands. Applicants contend that Qin differs from the presently claimed invention in that the product of the reference is a water-swellable, generally water-insoluble modified polysaccharide, i.e. carboxyalkyl polysaccharide, which has ester linkages with the cross-linking agent. However, as Qin also discloses, the water-insoluble carboxyalkyl polysaccharide is formed by mixing a water-soluble carboxyalkyl polysaccharide and a crosslinking agent, such as ethylene glycol. The water-soluble carboxyalkyl polysaccharide is made by modifying polysaccharide with a carboxyalkyl reagent; wherein the degree of substitution can be low (see col. 7, In. 4-15). Thus, the modified polysaccharide haing unsubstituted OH groups would form ether linkages with the crosslinking agent. Moreover, since Qin also discloses the same carboxyalkyl polysaccharide, i.e, carboxymethyl starch, and the same crosslinking agent, i.e. ethylene glycol, as presentty claimed, the product of Qin would inherently be the same.
